

Complete PHP & MySQL Viva Guide

1. What is PHP?

PHP is a server-side scripting language used to create dynamic websites and web applications.

Important Viva Questions:

- What does PHP stand for?

Answer: PHP: Hypertext Preprocessor

- Why do we use PHP?

Answer:

- To create dynamic websites
- To connect database
- To handle forms
- To manage login systems
- To store data

- Is PHP frontend or backend?

Answer: Backend language

2. What is MySQL?

MySQL is a database management system used to store data.

- Why use MySQL with PHP?

Answer:

PHP handles logic and MySQL stores data.

3. What is XAMPP?

XAMPP is a local server software package.

Full Form:

- X = Cross Platform
- A = Apache
- M = MySQL
- P = PHP
- P = Perl

- Why use XAMPP?

Answer:

To run PHP and MySQL on local computer.

4. What is localhost?

localhost means your own computer server.

Example:

<http://localhost/>

5. What is a PHP file?

A PHP file contains PHP code and has .php extension.

Example:

index.php

6. How to write PHP code?

```
<?php  
echo "Hello";  
?>
```

- What is echo?

Answer:

Used to print output.

7. Variables in PHP

Example:

```
$name = "Sumit";
```

Rules:

- Starts with \$
- No spaces
- Case sensitive

- Why use variables?

Answer:

To store data.

8. Data Types in PHP

Types:

- String
- Integer
- Float
- Boolean

- What is string?

Answer:

Text data.

9. Forms in PHP

Purpose:

Used to take user input.

Methods:

GET = Data visible in URL

POST = Secure

- Difference between GET and POST?

GET:

- Data visible in URL
- Less secure

POST:

- Data hidden
- More secure

10. Session in PHP

Session stores user data on server temporarily.

Example:

Login information.

- Why use session?

Answer:
To keep user logged in.

Session functions:
`session_start();`
`$_SESSION`

11. Cookie in PHP

Cookie stores small data in browser.

Difference Between Session and Cookie:

Session:
- Stored on server
- More secure

Cookie:
- Stored in browser
- Less secure

12. Array in PHP

Array stores multiple values in one variable.

Example:
`$colors = array("Red", "Blue");`

Types:
- Indexed Array
- Associative Array

13. Sorting Array

Functions:
`sort()` = Ascending
`rsort()` = Descending

- What is ascending order?

Answer:
Small to large.

- What is descending order?

Answer:
Large to small.

14. File Handling

Purpose:
Read and write files.

Functions:
- `fopen()` = Open file
- `fwrite()` = Write file
- `fread()` = Read file
- `fclose()` = Close file

- Why close file?

Answer:
To save memory/resources.

15. Login System

Basic Logic:
- User enters username/password
- PHP checks data
- If correct → login success

- Why use login system?

Answer:
To authenticate users.

16. MySQL Connection

Example:
`$conn = mysqli_connect("localhost","root","","test");`

- What is mysqli?

Answer:
MySQL Improved extension.

- Parameters used:
 - Server name
 - Username
 - Password
 - Database name

17. CRUD Operations

CRUD Full Form:
C = Create
R = Read
U = Update
D = Delete

- What is CRUD?

Answer:
Operations used to manage database records.

18. Insert Data into Database

Purpose:
Store form data into table.

SQL:
`INSERT INTO users(name,email)
VALUES('Sumit','a@gmail.com');`

19. Display Records

Purpose:
Show database data in table format.

SQL:
`SELECT * FROM users;`

- What does * mean?

Answer:
All columns.

20. Update Record

Purpose:

Modify existing data.

SQL:
UPDATE users
SET name='Rahul'
WHERE id=1;

- Why use WHERE clause?

Answer:
To update specific record.

21. Delete Record

SQL:
DELETE FROM users WHERE id=1;

- Why use ID in delete?

Answer:
To identify correct record.

22. Image Upload

Purpose:
Upload image from form.

Important:
move_uploaded_file()

- Why use enctype in form?

Answer:
To upload files.

Example:
enctype="multipart/form-data"

23. JavaScript Background Change

Purpose:
Change color dynamically.

- Why use JavaScript?

Answer:
To make webpage interactive.

24. Pattern Program

- What is nested loop?

Answer:
Loop inside another loop.

Pattern programs mostly use nested loops.

25. HTML Basics for Viva

- What is HTML?

Answer:
HyperText Markup Language.

- What is form tag?

Answer:
Used to create forms.

- What is input tag?

Answer:
Used to take input from user.

26. Important Database Viva Questions

- What is database?

Answer:
Collection of organized data.

- What is table?

Answer:
Collection of rows and columns.

- What is primary key?

Answer:
Unique identifier for each record.

- What is ID?

Answer:
Unique number of a record.

27. Most Important Viva Questions

PHP:

- What is PHP?
- Why use PHP?
- Difference between GET and POST
- What is session?
- What is cookie?
- What is array?
- What is echo?

MySQL:

- What is database?
- What is table?
- What is primary key?
- What is CRUD?

Practical:

- How login works?
- How form validation works?
- How image upload works?
- Why use MySQL connection?

28. Super Short Answers

PHP full form = Hypertext Preprocessor
MySQL use = Store data
Session use = Store user data
Cookie use = Store browser data
CRUD full form = Create Read Update Delete
GET method = Data in URL
POST method = Secure data
Echo use = Print output
Array use = Store multiple values

29. Security Questions

- Why use password field?

Answer:
To hide password.

- Why validate form?

Answer:

To check correct input.

30. Final Viva Tips

For viva you do not need deep programming knowledge.

You only need:

- Basic concepts
- Full forms
- Purpose of code
- Why we use it

That is enough to pass confidently.
